GROUP 8 PROJECT BRIEFING

Bus Agency Seat Booking System - Buea to Douala

The Project

A system for a Buea-Douala travel agency to manage buses, trips and seat bookings, replacing manual record-keeping.

Our Objectives

1. Brainstorm together and agree on the best features for the system.
2. Write the requirements and design the system before coding.
3. Build a working system (backend and frontend).
4. Test it.
5. Release Version 1.0 on GitHub with a user guide.
6. Every member contributes, with commits on GitHub.

BONUS (only if time allows): interview the agency or a real traveller to confirm our ideas.

How We Will Proceed

DAY 1	DAY 2	DAY 3
Get organised. Join GitHub, set up the board, brainstorm features in the group, start the rough data model.	**Write it down.** Turn the best ideas into written requirements and a use case diagram. Refine the design.	**Finish up.** Upload all documents to GitHub and get ready to code.

Team Rules

- Everyone accepts the GitHub invitation today.
- Everyone shares ideas during brainstorming. No idea is too small.
- Each team works on its own part and uploads documents to the **/docs** folder.
- Reply "done" in the group when you finish a task.
- The Project Lead checks in with everyone daily.

Teams

TEAM	MEMBERS
Project management	Mua Junior Tem (Lead), Brian-Austin Shiezi Mbe Jr
Analysis	Kwa Maxwill Mua, Mbaku Junior Williams Mudoh
Design	Glory-Anne Sombe Nganje, Nyaa Snowsel Bah Tah
Testing & QA	Beze Ombaks Njulefeh Jones, Masango Paula Ebude
Release & documentation	Djeubi Jesse Karston Mc-Voma, Ebwesuh Princewill

GROUP 8 PROJECT BRIEFING

Bus Agency Seat Booking System - Buea to Douala

Deliverables (from our teacher, Week 3)

These are the six levels of work we must deliver. Each has an owner team that makes sure it gets done.

LEVEL	DELIVERABLES	OWNER
1. Project management	a. Project plan b. Weekly progress notes	Project management
2. Analysis	a. Client interview *(bonus for us; requirements come from brainstorming)* b. Requirements specification c. Use case diagram	Analysis
3. Design	a. Architecture and data model b. API design c. Detailed design (class, sequence diagrams)	Design
4. Implementation	a. Products module b. Restock module c. Sales module d. Credit book module e. Reports module f. Users and login *Module names are the teacher's template. We will agree the bus-booking equivalents (trips, seats, bookings, payments, reports, users and login).*	All coders (5 backend, 3 frontend)
5. Testing	a. Unit tests b. API tests c. Acceptance test with the client	Testing & QA
6. Release	a. User guide and README b. Version 1.0 release	Release & documentation

Reminder: every member of the implementation team must have commits in the Git history. Individual marks depend on it.
